## **PRESS RELEASE** ***February 2004***

### **Flexible Photo Processing Filter**

Porvair Technology, based in Wrexham and a member of the Photo Marketing Association, has announced the development of a flexible new filter for the mini-lab processor market.

FotoFil is made from a specially formulated polyethylene material and its unique flexibility means easier fitting and removal of the filter by photo-lab technicians. "The material also has excellent filtration performance, extremely high strength and is fully recyclable," says John Parry, Technical Manager. A range of sizes is available to suit all modern processors, in low to high volumes as required.

Porvair Technology is a division of the Porvair Filtration Group, a specialist porous media and filtration company, with expertise in a wide range of media and many years experience in filtration. The Porvair Filtration Group designs and manufactures high performance filters for the most demanding environments in industries including aerospace and defence, chemical process, power generation, oil and gas, pharmaceutical and healthcare, air and water.
